OTO PARK

Decisions to confirm

A structured guide for the owner discussion

12 priority questions for the next discussion

Each question explains today's rule, why the answer matters and where the decision should be recorded. The complete reference section preserves all 116 numbered points.

13 October 2026

Project status SCRUM-191 and its twelve children are Deployed. Done follows the owner's full and final test suite.

How to use this pack

Start with questions 1-12. Record a choice or the information needed to answer it. For later optional items, the existing default can simply remain. Quote the question number when replying; answers are saved under the original plan reference or SCRUM-497.

Screenshots

Four inspected staging captures explain reporting, staff benefits, face-clock entry and Xero connection. Captions state their capture dates and what each screen demonstrates.

Discussion copy - 13 October 2026

Recording decisions 40

Decisions for upcoming work

Priority questions 1-12

Use this section to record the choices needed for upcoming work. A line for the answer is provided beneath each point.

1

Should Today count every party payment received that day, even if the party is on another date?

Analytics Q3 + events Q3; SCRUM-508

Current default: Current default counts payments taken that day for parties held that day. Alternative: all party payments received on that date.

Why the answer matters: Determines daily party revenue and is needed for SCRUM-508. The number of parties shown is a separate calculation and does not depend on this revenue choice.

Source
Answer / follow-up

2

When extra play time is added to selected bands, should Drop-off/Nanny time also extend?

SCRUM-493 decision checkpoint, extra-time care coverage (line 35)

Current default: Keep the supervision timer separate until answered. Alternative: extend both under an explicit rule.

Why the answer matters: Staff need to know when care is due to finish. Selected-band versus count-only is already answered: offer both.

Source
Answer / follow-up

3

Can part of an extra-time payment be refunded while keeping the minutes, or should only a full refund cancel the extension?

SCRUM-493 decision checkpoint, extra-time refunds (line 35)

Current default: No proportional reduction of minutes has been chosen. The open choice is whether a partial refund can leave all minutes intact or whether only a full refund should cancel the extension.

Why the answer matters: Determines the time entitlement after a refund.

Source
Answer / follow-up

4 During an internet outage, should each prepaid meal be served only by its assigned food counter, or should prepaid meal serving wait for internet?

SCRUM-493 decision checkpoint, offline meal service (line 39)

Current default: No exclusive-counter scheme is approved. Food and allergy information remains available offline, but independent boxes cannot confirm one shared remaining-meal balance during an outage.

Why the answer matters: Avoids serving the same prepaid meal twice and allows pickup reconciliation.

Source

Answer / follow-up

5 When credit bought at one park is spent at another, how should the parks divide that liability in their reports?

SCRUM-493 decision checkpoint, cross-park credit (line 43); analytics Q10

Current default: Spending across parks is delivered; network totals remain coherent. Current park reports distinguish issuing-park balances and spending-park movements.

Why the answer matters: The financial ownership rule must be explicit so each park shows its agreed share.

Source

Answer / follow-up

6 Should opening stock be counted once for the whole park or separately for each storage place?

SCRUM-485; consistency register entry 61

Current default: Per-place opening is the recorded implementation; first counts stay outside discrepancy totals under the recorded default.

Why the answer matters: This determines where opening quantities belong. Changing that structure later requires careful stock-history handling.

Source

Answer / follow-up

7 When prepaid lunch money is refunded, should its remaining spendable credit be removed, and should a refund be refused once that credit has already been spent?

SCRUM-481 - prepaid food refunds

Current default: The current owner queue records credit remaining spendable after refund. The proposed rule removes the prepaid part and refuses a refund once that credit has been spent; this proposal awaits a choice.

Why the answer matters: Keeps a refund and the remaining food balance consistent. This is separate from promotional ticket-credit clawback.

Source

Answer / follow-up

8 Should vouchers be allowed to add spendable credit without payment, who may issue them, and how should they appear in promotion reports?

SCRUM-482 - credit vouchers

Current default: The recorded till permits reception issuance. Keep this unchanged until an explicit ruling; the register proposes manager-only issuance or disabling this voucher type as alternatives.

Why the answer matters: Determines who can create promotional stored value and how the park distinguishes it from paid credit.

Source

Answer / follow-up

9 Should staff choose/type a booth PIN, or should the system issue it?

SCRUM-428 - booth PIN setup

Current default: The typed-versus-issued ruling remains open, so existing behavior continues. Button sign-in and PIN expiry are separate delivered choices.

Why the answer matters: Determines the staff setup and replacement process.

Source

Answer / follow-up

10 Should the new-station setup hide payment settings for a free prize booth, or keep them for a future paid-spin booth?

SCRUM-434

Current default: The drawer currently includes cards, QR, cash and an offline wallet limit for Booth stations. No change is selected yet.

Why the answer matters: A free prize wheel does not take payment. Hiding the step simplifies setup; keeping it preserves a possible future paid-spin configuration.

Source

Answer / follow-up

11 Does each branch need category-specific tax exceptions with an administration screen, or should the unused option be retired?

SCRUM-277

Current default: Retain the current till tax configuration without adding an exception rule.

Why the answer matters: A screen makes the option usable by park administrators; retiring an unused option removes ongoing support for it. Other unused groups need the same build-or-retire choice after their current usage is checked.

Source

Answer / follow-up

12 On a narrow phone, which till controls should move into a menu first so Lock remains reachable?

SCRUM-509

Current default: The existing phone bar keeps its controls in one row. A proposed order is to move theme and settings first while keeping Lock visible; this order needs confirmation.

Why the answer matters: Staff need quick access to locking and daily controls on small screens. Choosing the order allows the phone layout work to proceed without guessing which controls matter most.

Source

Answer / follow-up

Production information and operating arrangements

Reference questions 13-19

13 Were older records written in Bangkok time, UTC, or different time zones for particular imports?

Current default: Preserve the recorded values.

Why the answer matters: Converting them without this fact can move an attendance event or payroll date. A known event with its actual local time is useful evidence; the team will choose the conversion method after the meaning is confirmed.

Source | timestamp record

14 Who should receive urgent system alerts outside opening hours, and through which channel?

Current default: Console Failures, without a confirmed external recipient in the decision record.

Why the answer matters: Console-only monitoring requires somebody to look; a named email or messaging destination can reach the person expected to act. Specify a primary contact and backup, or retain Console only.

Source

15 Who will supply the final exports and stored files and confirm that required history is included?

Current default: The existing production system remains authoritative until the final import.

Why the answer matters: A complete handover must include documents and photos as well as database records. First check which exports are already available; an old checklist alone does not establish that something is missing today. Access details should be supplied through the approved secure configuration process.

Source

16 Which quiet period should be reserved, when should old-system edits stop and who will be available for the switch?

Current default: One switch after readiness, using the latest data, without a long period of both systems accepting changes.

Why the answer matters: The pause lets the final import catch all changes. The one-switch approach is already agreed; only timing and responsibilities need arranging.

Source

17 Should past check-in families become member records automatically?

Recorded proposal: Combine matching phone numbers and mark imported memberships unverified.

Why the answer matters: Importing them gives reception a populated member list; starting with explicitly registered members gives a narrower list. Either choice can retain historical visits. This asks about membership creation, not permission to discard history.

Source

18 Which tool uses the Radar summary feed, who maintains it and is the connection still needed?

Current default: Preserve existing integration behavior until the consumer is identified.

Why the answer matters: Knowing the receiving system and its owner allows the existing feed to continue at the switch. No credential values are needed in this document.

Source

19 What retention periods should apply to child photos, conversations and operational records, and who approves the final schedule?

Current default: Synthetic photos on staging and no general purge this sprint.

Why the answer matters: Financial history, child-release records and ordinary media have different purposes. The care plan records 30 days after release for its stored visit photo; the separate box-copy proposal is seven days. These are different storage locations, not one universal period. Record the chosen periods by category before enabling real-data deletion.

Source

Future Inbox decisions

Reference questions 20-26

20

Keep the latest brief's two statuses, three tabs, fixed backup pairs and Divert action? Name the primary and backup staff for English and Russian birthday enquiries.

Current default: The latest brief.

Why the answer matters: Two older briefs reverse the language assignments. Confirming named responsibilities prevents enquiries being routed to a different person than intended.

21

Should customers choose English, Russian or Thai, or should Inbox detect their language?

Current default: Automatic detection.

Why the answer matters: A chooser gives customers explicit control but adds a prompt; detection avoids that step and needs an easy handoff when the language is uncertain.

22

Which channels launch first, which WhatsApp or reception numbers belong to each branch, and should staff use named accounts on shared phones?

Current default: The latest brief; Telegram is a contact field without a connected adapter.

Why the answer matters: Channel ownership determines setup and routing. Name the account owner and secure connection process. LINE messaging does not, by itself, authorize a visitor self-registration feature.

23

Which calendar should reserve a birthday date from Inbox, and where should the final event order be saved?

Current default: Existing online events use the OTO App as their record source.

Why the answer matters: The future Book Date handoff needs one authoritative booking so two channels do not make independent reservations. This does not reopen the delivered event reads.

24

May AI send general replies directly, who maintains its answers, and what translation or transcription budget applies?

Current default: The latest brief allows general answers and hands birthday sales and named cases to people.

Why the answer matters: The chosen approval level determines response speed and staff responsibility; the budget and information owner make live operation manageable. This is separate from delivered Ask OTO.

25 Should staff receive phone notifications and reply on phones, and what reply-time target applies during opening hours?

Current default: Desktop-first and the existing average-response dashboard.

Why the answer matters: Phone support affects the working interface; a target needs named recipients for overdue alerts. Coordinate those recipients with the urgent-alert decision above.

26 Which earlier conversations should be imported, what permission covers marketing follow-ups, and should the dashboard keep its three metrics or use the six-metric reference?

Current default: No extra marketing behavior or retention rule is introduced.

Why the answer matters: These choices determine the initial Inbox workload, allowed follow-up use and reporting layout. Apply the category-specific retention answer above to conversation media as well.

Source for the seven Inbox questions | standing brief decision

Till checkout and family records

Reference questions 27-43

The recorded default remains unless a change is requested. These choices do not reopen the delivered lift scope.

27

Can a ticket-only promotion reduce socks or lockers after the ticket amount has already been discounted away?

SCRUM-497, consistency register entry 44

Current default: Recorded platform confines it to its own remaining ticket amount; the original calculation only capped at the whole bill. Confirm the scope-only limit or the original whole-bill calculation.

Why the answer matters: Changes the final amount when overlapping promotions are stacked. No currently held code was scoped this way in the recorded census.

Source

28

If a ticket has no price for a newly added customer tier, should it be unavailable or cost zero?

SCRUM-497, consistency register entry 45

Current default: Recorded platform refuses sale; original design shows zero.

Why the answer matters: Prevents unintended free sales or permits deliberate free tiers.

Source

29

Do price days, promotion dates and daily staff benefits reset at midnight or at the park's 05:00 trading-day boundary?

SCRUM-497, consistency register entry 46

Current default: Recorded platform uses 05:00; original pricing uses calendar midnight. Benefits Q6 links to this same answer.

Why the answer matters: Affects activity between midnight and 05:00. Ask once across modules.

Source

30

Who may permanently remove a member's verified rate: reception or a manager?

SCRUM-497, consistency register entry 47

Current default: Recorded removal needs a manager. Selling a verified member at the ordinary rate is already delivered separately.

Why the answer matters: Distinguishes a one-sale choice from changing the saved membership.

Source

31

May managers correct or remove a holiday pricing range after it has been used?

SCRUM-497, consistency register entry 48

Current default: Recorded platform freezes dates/removal; alternative permits edits while past sales keep their saved values.

Why the answer matters: Lets the park correct future use without rewriting past receipts.

Source

32

May reception refund a sale directly, or must a manager approve?

SCRUM-497, consistency register entry 49

Current default: Recorded gate requires a manager; original design allows a signed-in cashier. A manager co-sign would be a separate specified flow.

Why the answer matters: Determines whether the desk can help a family immediately.

Source

33

After a card payment can no longer be voided, should the family receive cash or a refund to the card where the terminal supports it?

SCRUM-497, consistency register entry 50

Current default: Cash is the recorded current fallback and earlier recommendation. Card return is the alternative, subject to actual terminal capabilities.

Why the answer matters: Affects cash drawer reconciliation and the family's wait for funds. The available choices depend on the payment provider confirming what the park's terminal supports.

Source

34 Can the same item be selected for a second partial refund?

SCRUM-497, consistency register entry 51

Current default: Recorded platform removes already-covered items; Amount remains available. Original design permits repeated selection within the remaining refundable amount.

Why the answer matters: Repeat adjustments on a partially refunded line.

Source

35 On a zero-baht ticket sale, should staff still select a payment method?

SCRUM-497, consistency register entry 52

Current default: Recorded platform offers Complete Sale without a tender; original ticket flow asks for a tender.

Why the answer matters: Receipt/report classification and one fewer desk step. F&B's zero-total flow is already part of the original design.

Source

36 On the POS booking website, should a verified returning parent see saved children and save their contact preference?

SCRUM-497, consistency register entry 53

Current default: Original-design default: restore this behind a one-time SMS check; the older arrival plan kept children hidden without verification.

Why the answer matters: Less repeat typing while protecting family information. **This is POS `/book` / SCRUM-357, not the OTO App camp SMS feature delivered under SCRUM-522.**

Source

37

If tax settings change after a family pays online, should reception still issue their bands using the booking's paid total and saved tax basis?

SCRUM-497, consistency register entry 54

Current default: Recorded platform refuses on a total difference. Proposed alternative keeps the paid basis and flags the difference.

Why the answer matters: Avoids holding up a paid family at arrival.

Source

38

Is booking up to 60 days ahead the desired limit?

SCRUM-497, consistency register entry 55

Current default: Recorded platform: today through 60 days. Alternative: another limit or a branch setting.

Why the answer matters: How far ahead families may plan.

Source

39

Should a drop-off walk-in automatically get a saved member profile?

SCRUM-497, consistency register entry 56

Current default: Recorded platform creates one from the parent's phone; original design only saves to an existing member.

Why the answer matters: Returning-family convenience and which families enter the member records.

Source

40

Should staff be able to remove someone from today's authorised pickup list?

SCRUM-497, consistency register entry 57

Current default: Recorded platform has Take off the pickup list; original design only adds/edits.

Why the answer matters: Controls who can collect the child after plans change.

Source

41

Should an edit on today's child-care board also update that child's saved profile for future visits?

SCRUM-497, consistency register entry 58

Current default: Recorded platform updates both; original design changes only the stay.

Why the answer matters: Whether an allergy/name correction persists to the next visit.

Source

42

If one flavour or size is sold out, may the remaining ones still be sold?

SCRUM-497, consistency register entry 62

Current default: Recorded platform keeps the tile available with Low; original design marks the whole tile Out.

Why the answer matters: Whether stock in other variants remains available for sale. The current stock narrowing does not specifically settle this F&B display choice.

Source

43

May parents add or remove saved children on the customer display, and should the age limit match the till's 12 years?

SCRUM-497, consistency register entry 65

Current default: Original-design default permits the parent's changes and caps at 12; recorded paired display asks staff for new/removal actions and permits up to 17.

Why the answer matters: Parent independence and one consistent age range.

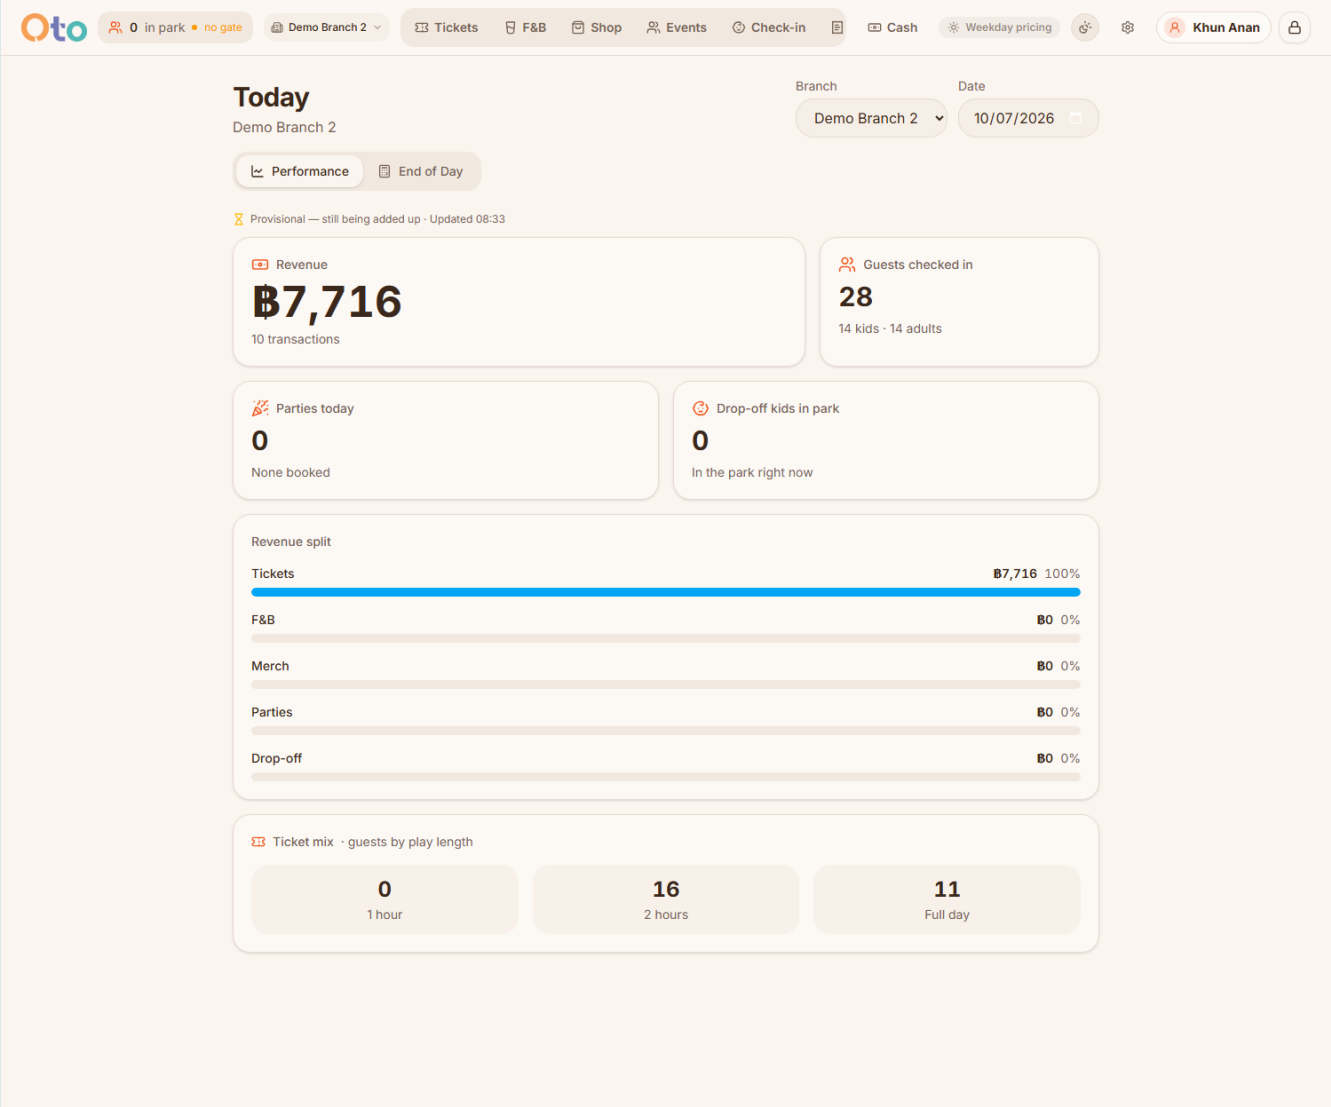

Source

Reporting choices

Reference questions 44-53

The recorded default remains unless a change is requested. These choices do not reopen the delivered lift scope.

Today and its revenue categories

Staging capture, 7 October 2026. Provisional figures and five revenue categories illustrate questions 1 and 44-53. The image does not choose a party-payment date or demonstrate a later policy change.

Reporting choices continued

44

Should a reporting day begin at 05:00 Bangkok time?

Analytics plan Q1

Current default: Branch business date, 05:00; choose another branch start if needed.

Why the answer matters: Keeps late trading with the same day's cash-up. Point 29 asks whether pricing and benefit resets should use this same boundary; the reporting boundary can remain unchanged even if those rules differ.

Source

45

Keep camp and event passes under Tickets, or give them a separate revenue bar?

Analytics plan Q2

Current default: Tickets; five bars remain. Only the care service appears under Drop-off.

Why the answer matters: Readable category comparisons. Links events Q2.

Source

46

Should a later refund reduce the original sale day or the day the refund was paid?

Analytics plan Q4

Current default: Original sale day, even after that day was closed; the closed cash-up record stays frozen.

Why the answer matters: Historical revenue versus daily money movement.

Source

47

Should revenue include VAT and service charge?

Analytics plan Q5

Current default: Gross inclusive figure; alternative net revenue.

Why the answer matters: Keeps reports comparable. This asks about the platform's revenue presentation; the accepted legacy Radar formulas remain unchanged.

Source

48

Keep ticket credit counted when sold, with spending excluded and no extra revenue change when it expires?

Analytics plan Q6

Current default: Yes. Alternative needs an explicit expiry accounting rule.

Why the answer matters: Avoids counting the same money twice.

Source

49

Show today's figures while they are still being added up, or show completed days only?

Analytics plan Q8

Current default: Show today with Provisional label.

Why the answer matters: Staff can see current activity before totals are complete. The reporting screenshot above illustrates the Provisional label.

Source

50

Keep one-branch Performance available to users who can open Today, and limit All branches to their permitted branches?

Analytics plan Q9

Current default: Yes.

Why the answer matters: Which managers/staff see cross-branch figures.

Source

51

Show booth totals beside the voucher counts staff type at End of Day?

Analytics plan Q11

Current default: Current manual entry remains; comparison would be an addition.

Why the answer matters: Helps staff compare their count without replacing it.

Source

52

In Ticket type sales, should care fees and food remain on the separate care card?

Analytics plan Q15

Current default: Yes; ticket row contains ticket price only. Alternative includes care fee/food in the ticket row too.

Why the answer matters: Prevents comparing unlike ticket values.

Source

53

Keep earlier demo sales visible in the original park's reports, or mark them out of totals while retaining their records?

Analytics plan Q16

Current default: Keep them.

Why the answer matters: Clean operational reporting without deleting recorded sales.

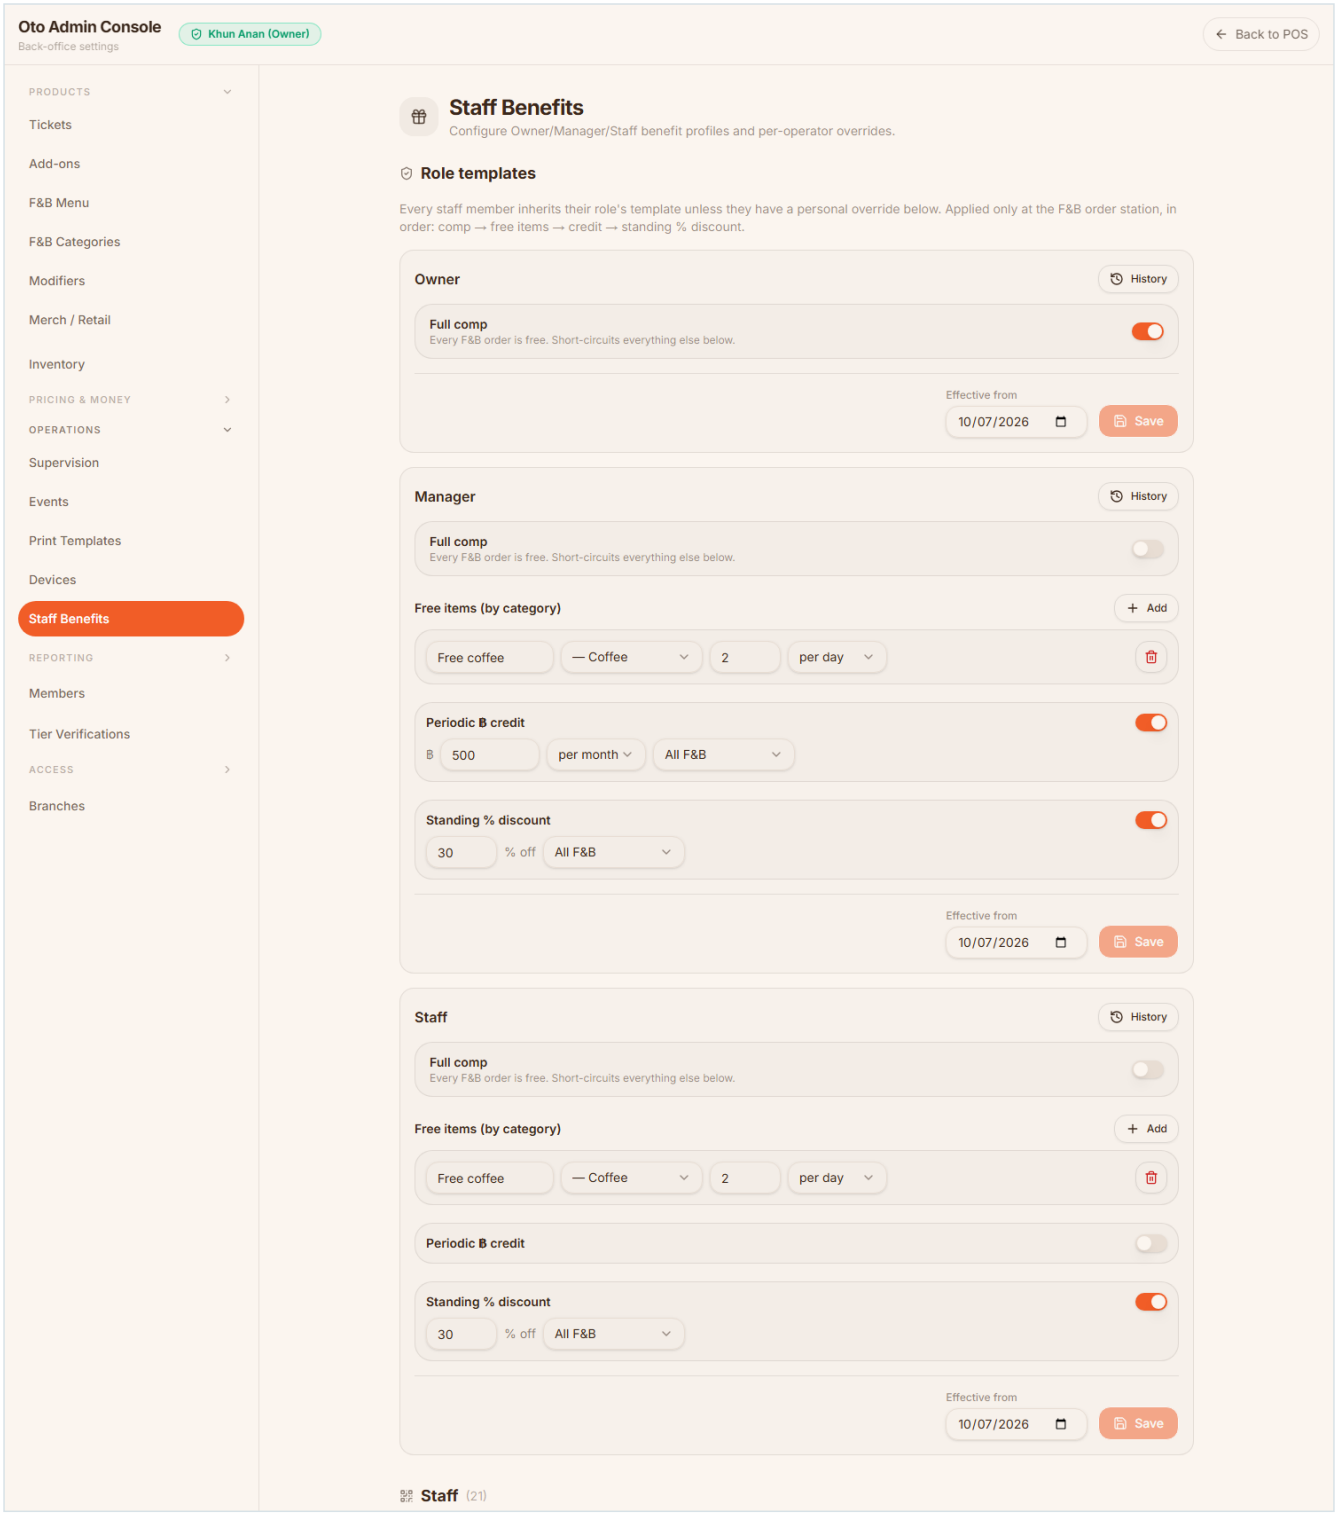

Source

Staff benefit preferences

Reference questions 54-64

The recorded default remains unless a change is requested. These choices do not reopen the delivered lift scope.

Staff benefit amounts and reset periods

Staging capture, 7 October 2026. Owner, Manager and Staff role settings illustrate questions 54-64. These are configured settings, not current balances. No benefit QR is shown.

Staff benefit preferences continued

54

Should a personal benefit override replace the person's whole role package, or only the fields changed?

Benefits plan Q1

Current default: Whole package. A partial override would inherit unspecified benefits.

Why the answer matters: Determines whether changing one allowance also replaces the person's other role benefits.

Source

55

Confirm the actual benefit amounts for each role.

Benefits plan Q2

Current default: Owner: full comp; Manager: 2 coffees/day, ฿500/month, 30% F&B; Staff: 2 coffees/day, 30% F&B. Values are editable. The benefit-settings screenshot above illustrates these recorded amounts.

Source

56

Does applying a full comp need separate approval?

Benefits plan Q3

Current default: Recorded activity is enough under the existing rule; extra approval is the alternative.

Why the answer matters: An additional approval adds a second step before the order can be completed.

Source

57

When a benefited order is refunded, should used coffee/credit allowances return?

Benefits plan Q4

Current default: They stay used. Returning allowances would permit reuse within the period.

Why the answer matters: Determines the person's remaining entitlement after a refunded order.

Source

58

Keep staff benefits at F&B only, or also accept them at the ticket till?

Benefits plan Q5

Current default: F&B only. Defines where a benefit can be spent.

Source

59

Round benefit discounts to whole baht or satang?

Benefits plan Q8

Current default: Whole baht, matching the current manual percentage discount rule.

Why the answer matters: Determines the final discount and receipt total where the calculation contains fractions of a baht.

Source

60

May the cashier apply their own benefit card?

Benefits plan Q9

Current default: Yes; both identities are recorded. Extra approval or another cashier would be a new rule.

Why the answer matters: Determines whether a staff purchase needs another employee available to complete it.

Source

61

Is one Staff benefit line in Discounts & Comps enough, or should it split free items, credit, comp and percentage discount?

Benefits plan Q10

Current default: One line; detailed data already exists in the benefits report. This is a display choice.

Source

62 Keep staff benefits after the bill's manual discounts and before promotion codes?

Benefits plan Q11

Current default: Yes. Changing the order can change the benefit and total.

Source

63 If a benefit card is refused, should the customer screen show the staff name?

Benefits plan Q12

Current default: Existing wording names the person. Alternative: a plain refusal for guests, name on staff screen only.

Why the answer matters: Determines which staff details nearby guests can see during a refused benefit attempt.

Source

64 Should manually typed benefit-like reasons using lookalike letters be refused?

Benefits plan Q13

Current default: They remain ordinary recorded manual-discount reasons and grant no extra rights. Refusing similar-looking text would make discount descriptions more consistent without changing benefit permissions.

Source

Event camp and kiosk preferences

Reference questions 65-72

The recorded default remains unless a change is requested. These choices do not reopen the delivered lift scope.

65

Should party add-ons stay on the party bill only, or create ordinary sales, kitchen tickets, stock movements and bands?

Events and kiosk plan Q3

Current default: Party ledger only. Creating ordinary sales would also trigger their operational effects. Point 1 covers when party payments appear in daily revenue; this point covers how the add-ons are fulfilled.

Source

66

When a walk-up joins the remaining camp days, charge once or at each day's check-in?

Events and kiosk plan Q5

Current default: Pay one day's price once and register from today to the end. Per-day payment changes how the desk collects money.

Source

67

Keep the generic walk-up camp/event prices for reference, while pass sales use each event's own price and party extras use the party-guest price?

Events and kiosk plan Q8

Current default: Yes. Pass sales use each event's price and party extras use the party-guest price. A different role for the generic prices would be an optional new pricing flow.

Source

68

Is 60 seconds without a touch or scan the right kiosk reset time?

Events and kiosk plan Q9

Current default: 60 seconds returns to the welcome screen and records abandonment. Longer gives families more time; shorter clears their screen sooner.

Source

69

Treat birthdays, private events and school groups as parties; camps as camps; the other types as events?

Events and kiosk plan Q10

Current default: This mapping is delivered and remains accepted. A different classification would change which billing flow applies.

Source

70

Should cancelled camps/events still offer pass cards at the till and booking site?

Events and kiosk plan Q12

Current default: Existing cards remain visible until answered. Hiding them would stop new pass sales for cancelled events.

Source

71

Should text such as "None" in an allergy field still trigger the red allergy badge?

Events and kiosk plan Q13

Current default: Any non-empty text triggers it. Alternative needs an agreed list/rule; diet words may also be present.

Source

72

Keep other-park, cancelled or expired bookings on this park's kiosk help desk list, or move them out after staff review/end of day?

Events and kiosk plan Q14

Current default: Listed for staff help. Wording and an end-of-day sweep are still a choice.

Source

Outage and arrival operating preferences

Reference questions 73-85

The recorded default remains unless a change is requested. These choices do not reopen the delivered lift scope.

73

Unlock an offline till with the existing password or a short station PIN?

Offline plan OD2

Current default: Password. A PIN is an optional change, separate from booth PIN policy.

Source

74

If an offline card terminal took payment but the till got no answer, may staff record the terminal's approval code?

Offline plan OD3

Current default: Proposed recorded confirmation for reconciliation; actual terminal screen must support it. This is distinct from confirming no money was taken.

Source

75

Are a warning after 24 hours without a price update and stopping new sales after 7 days acceptable?

Offline plan OD5

Current default: Those two cache ages are the current proposed settings. Determines outage tolerance versus stale prices.

Source

76

Allow offline sign-in for staff seen on that box in the past 30 days if the dismissal list is less than 72 hours old?

Offline plan OD6

Current default: Yes under the recorded bounds. Controls who can work during an outage.

Source

77

Should discounts, comps or tier changes need a second person while offline?

Offline plan OD11

Current default: Same permissions as online, no new second-person step; refunds/voids remain refused offline.

Source

78

Confirm offline spending cap and wallet expiry.

Wallet plan OD-W1. Also offline plan OD14

Current default: The wallet plan records ฿300 per wallet/day, same-day expiry and refund of unused prepaid value as configurable policy. Point 7 separately covers a refund after credit has been spent; point 80 covers promotional ticket credit. These balances need distinct rules.

Source

79

Should ticket credit be based on list price before discounts?

Wallet plan OD-W2

Current default: Yes. Discounting the ticket does not reduce its credit grant.

Source

80

Should refunding a ticket remove the promotional credit it granted?

Wallet plan OD-W4

Current default: Promotional credit stays under the original rule. Removing it would require a changed refund rule. This differs from prepaid-food credit in point 7, where the family paid for the credit itself.

Source

81

Keep the platform nanny roster, or feed it from the OTO App schedule?

Checkin plan OD-C4

Current default: Seeded platform roster now; future schedule feed is a separate requested integration.

Source

82

During an outage, should a newly printed band unknown to the gate send the guest to reception?

Arrival plan OD-A5

Current default: Yes. Online the box asks the platform first.

Source

83

Accept that the same booking redeemed at two offline boxes is discovered on reconnect?

Arrival plan OD-A9

Current default: Yes, per existing offline limitation; same-box tills share one log. This is an operating limitation requiring awareness, not a promise of offline global single-use.

Source

84

Confirm the unpaid booking timeout and allow a late successful payment to confirm with an alert?

Arrival plan OD-A11

Current default: Configured payment window, late payment still confirms because no capacity limit is in use.

Source

85

Is inferred gate health sufficient where the controller does not send its display's fault code?

Arrival plan OD-A13

Current default: Yes; Health reports the faults it can observe. Showing the controller's own display code depends on the supplier exposing it through the connection.

Source

Later booth and hardware inputs

Reference questions 86-89

The recorded default remains unless a change is requested. These choices do not reopen the delivered lift scope.

86

How should a free-product voucher be honoured at a different park?

Booth closing review Q7; SCRUM-405

Current default: The voucher uses its linked product at the selling park. Cross-park choices are a matching product name at redemption or an explicit product link per park. The existing configuration workaround remains available while the preferred process is chosen.

Source

87

May a staff manual discount or member-tier price be used with a booth voucher?

Booth closing review Q8

Current default: Manual discounts currently coexist; member-tier pricing remains a separate open choice in booth plan decision 7. Other voucher/promotion combinations remain excluded under the accepted rule.

Source

88

Should changing a voucher's value affect slips already printed?

Booth closing review Q11

Current default: Yes immediately. Alternative freezes printed amount/percentage; previously unlinked free-product/1+1 slips still need their product link.

Source

89

Supply the published legacy voucher data and identify the static-QR switch date/campaign windows.

SCRUM-426; booth plan legacy voucher import

Current default: Legacy short codes remain unavailable until the published campaign data can be imported. The actual codes and campaign windows need a secure handover to support existing printed vouchers.

Source

Staff app inputs for future work

Reference questions 90-94

90 Should administrators select branches when granting OTO App access?

Q7 / SCRUM-469

Current default: Platform provisioning grants all branches. The branch picker remains held for the owner's go.

Why the answer matters: A picker would retain the selected branches instead. This is future access-management work; scheduling's park-group protection is already delivered.

Source

91 Keep face clock-in off in production, or schedule activation and face re-enrollment?

Q9

Current default: Off is the standing decision; PIN and phone alternatives remain.

Why the answer matters: Activation needs configuration, re-enrollment and controlled positive verification. Optional attendance evidence is built, but its face-enabled staging upload was not demonstrated.

Source

92 Does an outside service still use the older shared HR directory connection, and who maintains it?

Q13

Current default: Where configured, it serves the default park group only; staging leaves it unset.

Why the answer matters: A caller inventory determines compatibility and migration planning. No retirement decision or secret/key value is requested.

Source

93 Which test organisation and responsible administrator should complete the controlled Xero connection and report check?

Q15

Current default: Synchronization is manual. Recorded staging evidence shows the unconnected state; positive sandbox exchange remains unavailable.

Why the answer matters: Providing the organisation and operator enables real integration verification. This does not authorize a schedule or change completed feature scope.

Source | staging limit

94 Can separate report lines share the same section, name and location? Please provide an example or the source field distinguishing them.

Q55

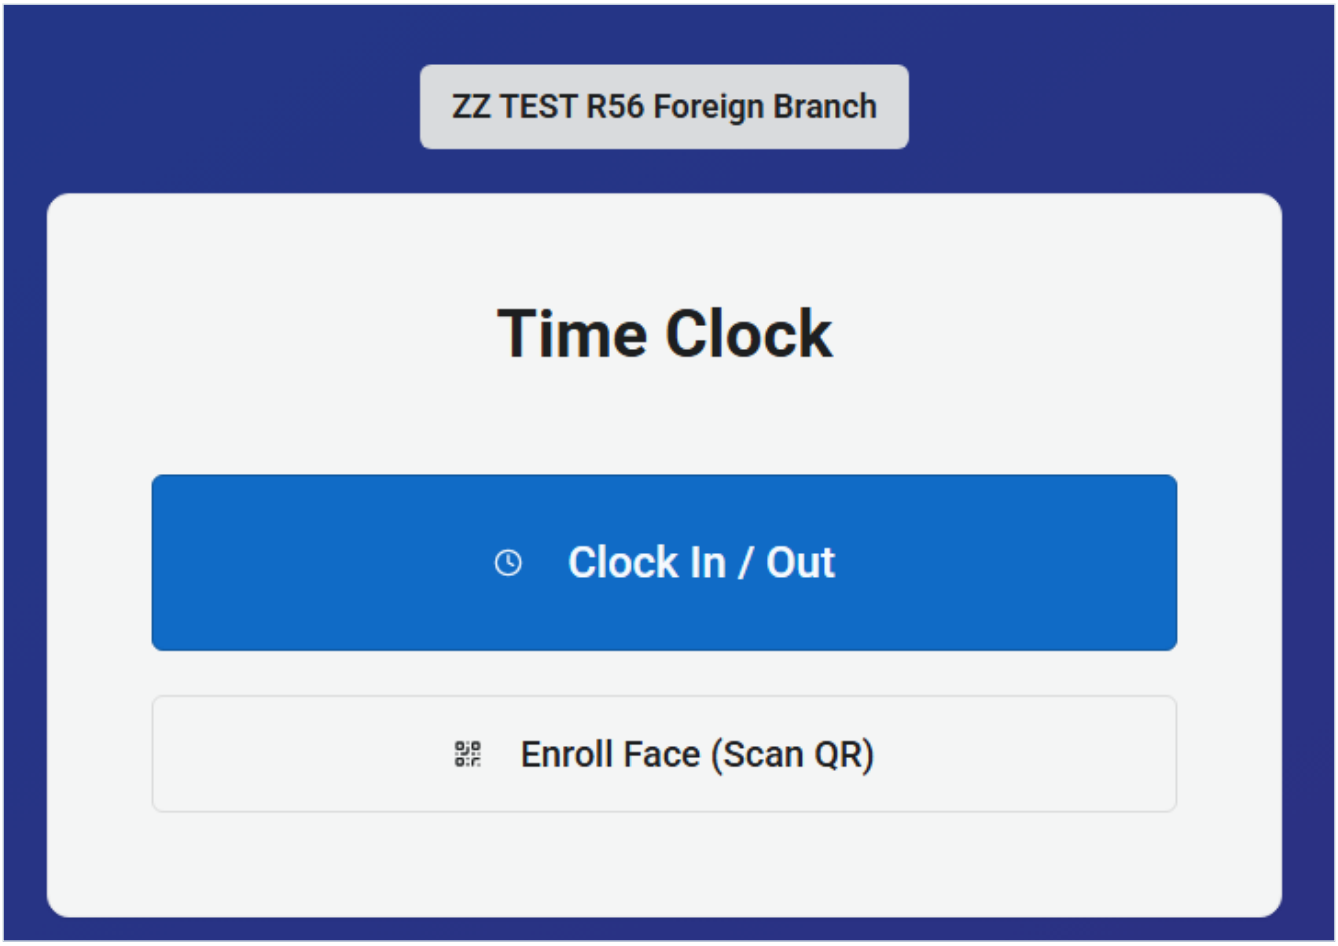

Current default: Every returned cell is retained in a fresh snapshot.

Why the answer matters: A reliable source identity could support another duplicate safeguard. Display labels alone must not merge distinct lines. Existing finance keys and atomic imports are delivered.

Source

Face-clock entry on staging

Illustration for question 91

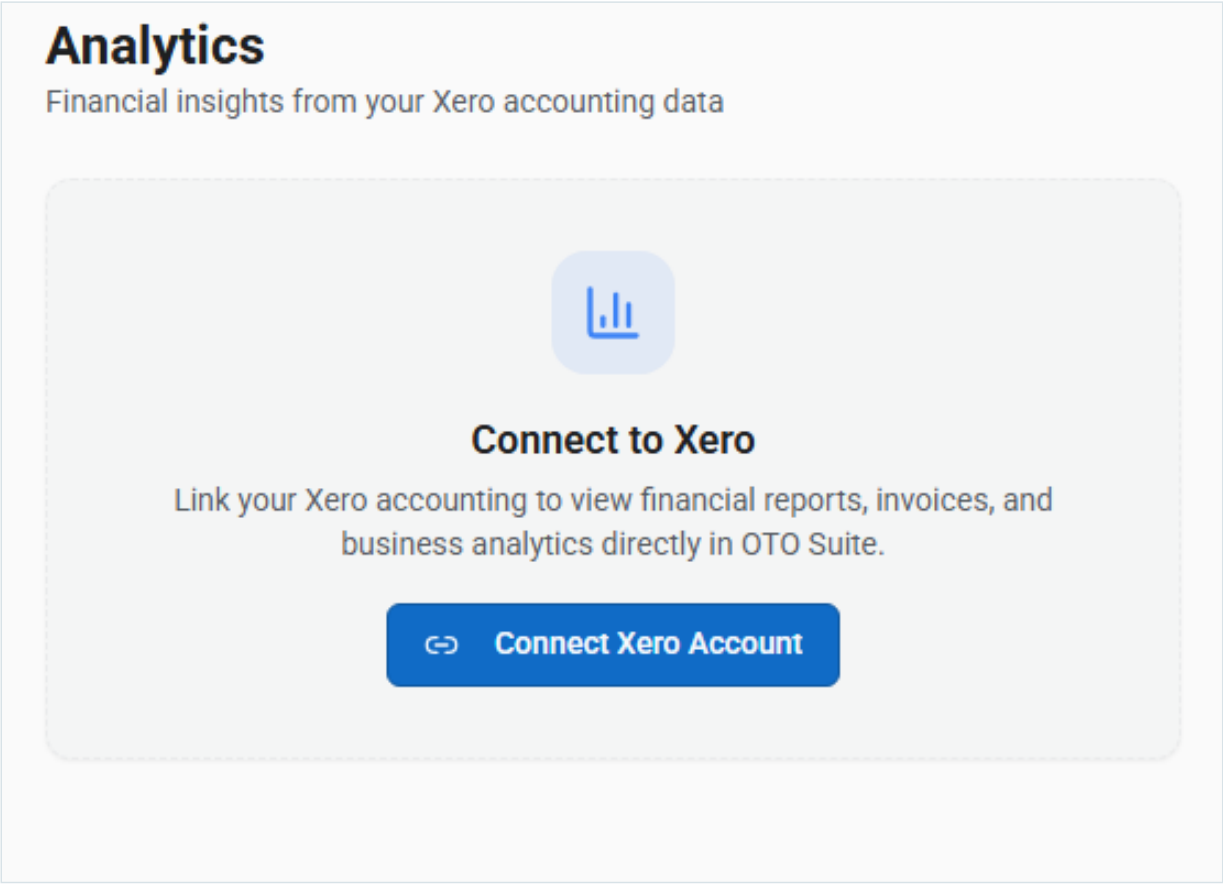

Staging capture, 13 October 2026. Cropped to the branch label and time-clock panel for legibility. Face use remains disabled by the standing setting; successful enrollment or an attendance attachment is not demonstrated.

Decision to discuss Keep face clock-in off in production, or plan activation with configuration and face re-enrollment?

PIN and phone alternatives remain available. See question 91 for the complete decision and source.

Xero connection on staging

Illustration for questions 93 and 101

Staging capture, 13 October 2026. Cropped to the connection panel for legibility. No successful exchange or populated accounting report is claimed.

Information needed Name the test organisation and the administrator who will connect it.

The separate policy choice is whether synchronization should remain manual or later run on a schedule. See questions 93 and 101.

Optional staff app policy changes

Reference questions 95-116

The recorded default remains unless a change is requested. These choices do not reopen the delivered lift scope.

95 Should leave have a separate pending, approved or rejected process?

Q1

Current default: Leave counts as approved; sick-day actions retain existing shift handling. No separate leave approval status is stored.

Why the answer matters: A stored workflow adds stages, approver/time and rejection rules. Delivered employee review/history approval is separate and remains complete.

Source

96 Keep every shift grouped, with a destination-group picker when deleting a populated group?

Q2, Q45

Current default: Groups are required; staff move shifts before deleting their group.

Why the answer matters: A picker simplifies the existing workflow. Allowing ungrouped shifts would be a separate structural choice, not a consequence of adding that picker.

Q2 | Q45

97 Should casual workers or advisors also appear, or should staff updates arrive more quickly?

Q3

Current default: Non-left employees, including pending employees, are copied every 15 minutes and on Run now; casual workers and advisors remain separate.

Why the answer matters: Expanded coverage changes downstream staff and benefit lists; another interval changes freshness. Existing coverage and frequency remain accepted.

Source

98

Should leaving automatically switch off launcher/till access too?

Q4, Q23

Current default: The app login follows the last-working-day process. Active linked suite accounts are reported for administrator action, including scoped email-fallback matches.

Why the answer matters: Automatic deactivation removes suite access without separate action. Restricting reports to direct links would omit email-only matches. Keep current reporting unless another rule is chosen.

Q4 | Q23

99

Should app password controls point to the launcher, and should creating an app user also create a suite account?

Q5, Q6

Current default: Existing controls remain; administrators use Console Link for suite sign-in.

Why the answer matters: Guidance changes the screens. Automatic suite creation requires phone details that app user creation does not currently require. These are independent choices.

Source

100

Should midnight clock-outs be labelled System instead of Face?

Q10

Current default: The recorded label is Face.

Why the answer matters: System would distinguish automatic activity in reports. Keeping Face preserves the existing classification; it does not mean a face was matched at midnight.

Source

101

Keep Xero synchronization manual or run it on a schedule?

Q15

Current default: An administrator starts synchronization.

Why the answer matters: A schedule needs the intended park/organisation and timing. Providing sandbox access alone does not choose a schedule.

Source

102

Record a continuing issue each run, or only when it changes?

Q17

Current default: Every run records it, with cases grouped on Failures.

Why the answer matters: Change-only reporting reduces repeated records but must keep unresolved cases visible. Per-run recording preserves an account of each check.

Source

103 Should administrators get a guided settlement tool when one person has two platform employee records?

Q20

Current default: No settlement screen exists; provisioning order avoids the situation.

Why the answer matters: A tool would let an administrator choose the retained record, move the account link and archive the other. The person and retained record must be explicitly identified.

Source

104 Show only verified employee numbers, or also the HR-entered number when unverified?

Q21

Current default: Only the verified number is copied; the platform phone may be blank.

Why the answer matters: A fallback improves completeness but must remain distinguishable from verification and must not grant contact authority.

Source

105 After a whole day of downtime, recreate missed work for its original date?

Q24

Current default: Jobs process the present date; earlier recurring tasks are not recreated and old clock-ins or guest stays close at the later midnight.

Why the answer matters: Historical catch-up changes dates and task generation. Keeping the current behavior leaves that recovery manual.

Source

106 Is a production Run now action needed, including repeating a completed night?

Q22, Q25

Current default: Production follows the documented rollout and schedule; staging Run now respects the batch hour and completed date.

Why the answer matters: A production control or forced repeat adds operator capability. The completed staging switch and recovery evidence do not need approval again.

Q22 | Q25

107 Should a new park group inherit default settings and company-wide leave numbers until it saves its own?

Q28, Q49

Current default: Fallback includes signatory/settings and leave policy; sick leave has its separate own-park default.

Why the answer matters: Removing fallback uses built-in values until configuration. This affects contract signatory details and entitlements, so the setup policy should be deliberate.

Q28 | Q49

108 Check shift/coverage alerts automatically, and keep alerts open until their responsible check clears them?

Q32, Q33

Current default: Shift rules run on Refresh; six-hourly reconciliation can resolve alerts raised by other checks.

Why the answer matters: Automatic shift checks and rule-specific resolution change when alerts appear and disappear. The current pattern remains accepted until follow-through is chosen.

Source

109 Apply assigned-branch limits consistently to scheduling, leave, tablet management, checklist history, letters and contract actions?

Q39, Q40, Q41, Q46, Q50

Current default: Within one park group, listed actions retain established permissions; some allow wider branch reach.

Why the answer matters: Additional restrictions change managers' duties and need explicit module/role choices. Separation between park groups is required and already delivered independently.

Q39-Q41 | Q46

110 Hide enrollment reminders while face clock-in is off?

Q42

Current default: The reminder rule remains enabled.

Why the answer matters: Hiding reminders removes an action staff cannot currently complete. Keeping them preserves the existing reminder rule. Neither option enables face clock-in.

Source

111 Should saving a sick day remove existing shifts and create coverage alerts?

Q44

Current default: A manager removes the shifts first.

Why the answer matters: Allowing the sick day over shifts automates freeing them and coverage notices. The separate simultaneous-save consistency case is engineering follow-through, not another business approval.

Source

112 Should a rehired employee receive fresh offboarding when they leave again?

Q47

Current default: One offboarding record is permitted per employee.

Why the answer matters: Repeated departures need a closed/history model and one-current-record rule. Keeping current behavior retains the prior offboarding record.

Source

113 Use the form's readable reason in letters/history when no custom reason is entered?

Q51

Current default: The panel shows readable words; saved/default letter content can still use the reason code.

Why the answer matters: Readable text improves default letter and history wording. A separate code field remains available for templates requiring it.

Source

114 Provide copied starter documents, and keep role definitions shared or separate?

Q53, Q54

Current default: Templates, policies and catalogue start empty within each park group; role definitions remain shared with scoped employee holders.

Why the answer matters: Starter copies reduce setup work without sharing owned documents. Separate roles require each group to establish its own before assignment. These choices are independent.

Source

115 Who should administer global sign-in limits, and where?

Q57

Current default: Park Data Admin shows the ownership notice rather than global activity.

Why the answer matters: A centrally authorized support/admin workflow would be additional scope. Per-park screens must not gain other parks' sign-in activity.

Source

116 Keep the app's tablets in their own device list, or include them in Console Devices?

Q14

Current default: The app pairs and lists its own tablets separately.

Why the answer matters: A unified list could simplify administration across devices, but its display and pairing responsibilities would need to be defined. Keeping separate device management remains the accepted default.

Source

Recording decisions

What stays accepted

The delivered lift, its original seven features and scheduling park-group separation retain their named evidence. App and platform access lifecycle follow-through remains under SCRUM-288. Final test acceptance is a separate step; tickets stay Deployed.

How answers are saved

Quote this pack's point number and the chosen alternative, or say to keep the default. Supply an example, contact or date where the question asks for information. The original plan question or SCRUM-497 is the permanent decision record.

Conditional and technical records

Historical ownership settlement is requested only if actual affected records are found. Reliability controls, technical locks and compiler work remain engineering decisions. SCRUM-223 stays paused until bench time is scheduled.

Scope of the reference

The pack reconciles the current open-item register, central decisions, remaining SCRUM-497 details, lift Q1-Q57, feature Q1-Q8, benefits Q1-Q13, events Q1-Q14 and analytics Q1-Q17. Duplicates and settled technical entries are omitted from the questions. No product rule changes through this document.
